

Pathophysiology & Treatment Algorithm of Acquired Flatfoot

*With EFAS Education
Committee*

Adult Acquired Flatfoot

A symptomatic, progressive flatfoot deformity resulting from loss of function of the tibialis posterior muscle or tendon and/or the loss of integrity of the ligamentous structures supporting the joints of the arch and hindfoot.

TPTD – Functional Anatomy

Definition

Aetiologies

Pathomechanics

Pathoanatomy

Clinical assessments

Imaging

Treatment

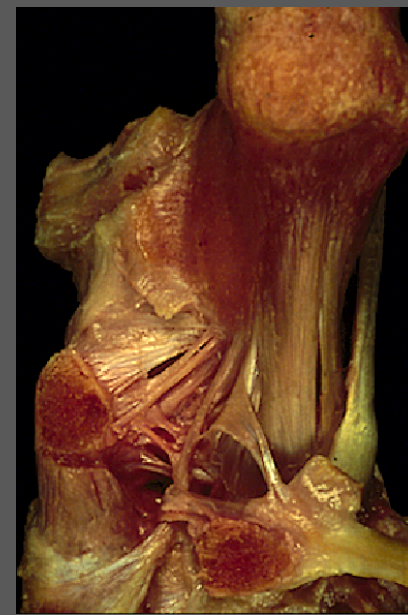

Conservative

Surgical

Indications

TOM

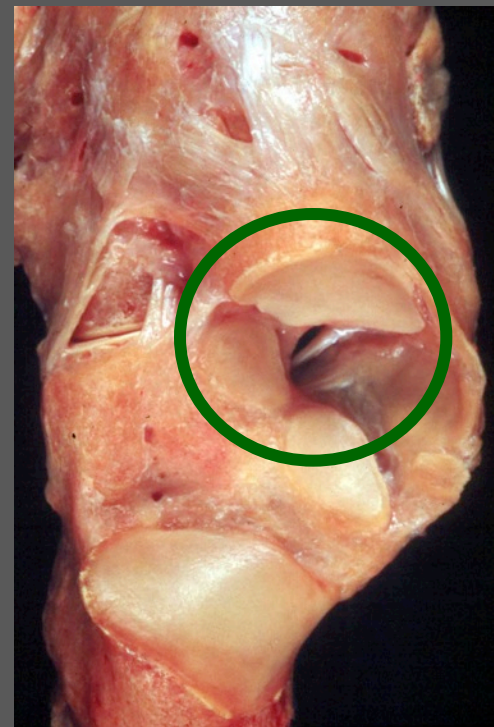

- Separate fibro-osseous groove
- Tenosynovial sheath
- Multiple insertions (plantar navicular/med. cuneiform)
- Primary antagonist is Peroneus Brevis
- TP is twice as strong as PB

TPTD – aetiologies

- Impingement in fibro-osseous groove
- Presence of accessory navicular increases dysfunction rates
- Hypovascular – behind medial malleolus (abnormal often distal to this point)
- Chronic tenosynovitis (inflammatory arthritides)
- Steroid injections
- Chronic mechanical overload & tendinosis (congen. pes planus, obesity, DM)
- Trauma

What comes first ? static or dynamic failure

Definition

Aetiologies

Pathomechanics

Pathoanatomy

Clinical assessments

Imaging

Treatment

Conservative

Surgical

Indications

TOM

Most orthopedic surgeons support the concept that the primary mode of failure is the loss of dynamic arch support (PTT mainly)

Other research focus more on a tension failure of the static restraints of the medial longitudinal arch (spring and deltoid lig., plantar fascia)

the pathophysiology is still debated

Instructional Course

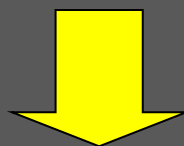

EFAS 2014

Poznan

Side effects of abnormal pronation

forces exceeding the static and dynamic restraints of the foot
create progressive medial structures degenerative dysfunction
(PTT - spring and deltoid ligaments)

progressive subluxation

MRI

Conti et al (1992) classified the MR appearances:

- Type 1: longitudinal splits without tendinopathy
- Type 2: swelling and degeneration
- Type 3: replacement of tendon substance with scar
- MR appearances better guide to outcome than surgical findings.
 - Tendon transfers were significantly more successful in type 1 tendons, but tendons graded type 1 by the surgeon were graded type 2 by MR in 10/17 patients - intra-operative assessment may lead to inappropriate choice of treatment.
